

Analyzing dementia SPECT data

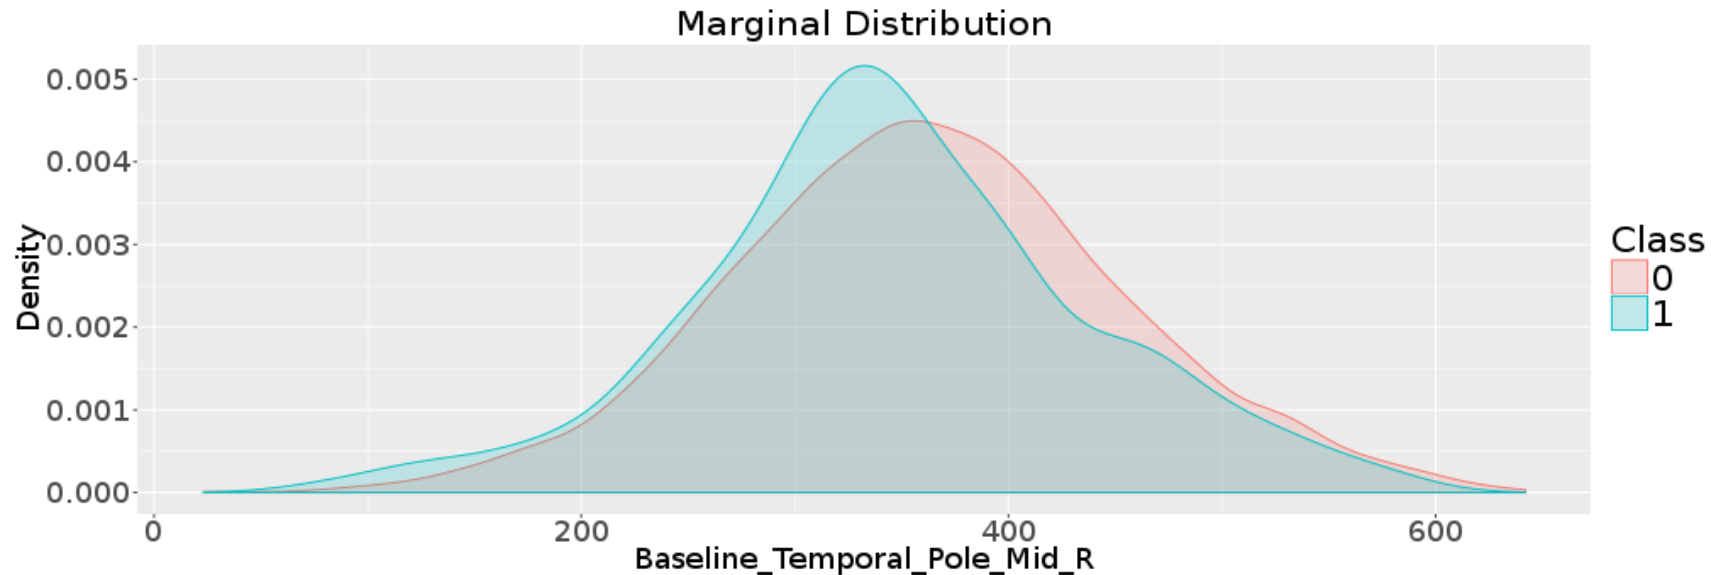

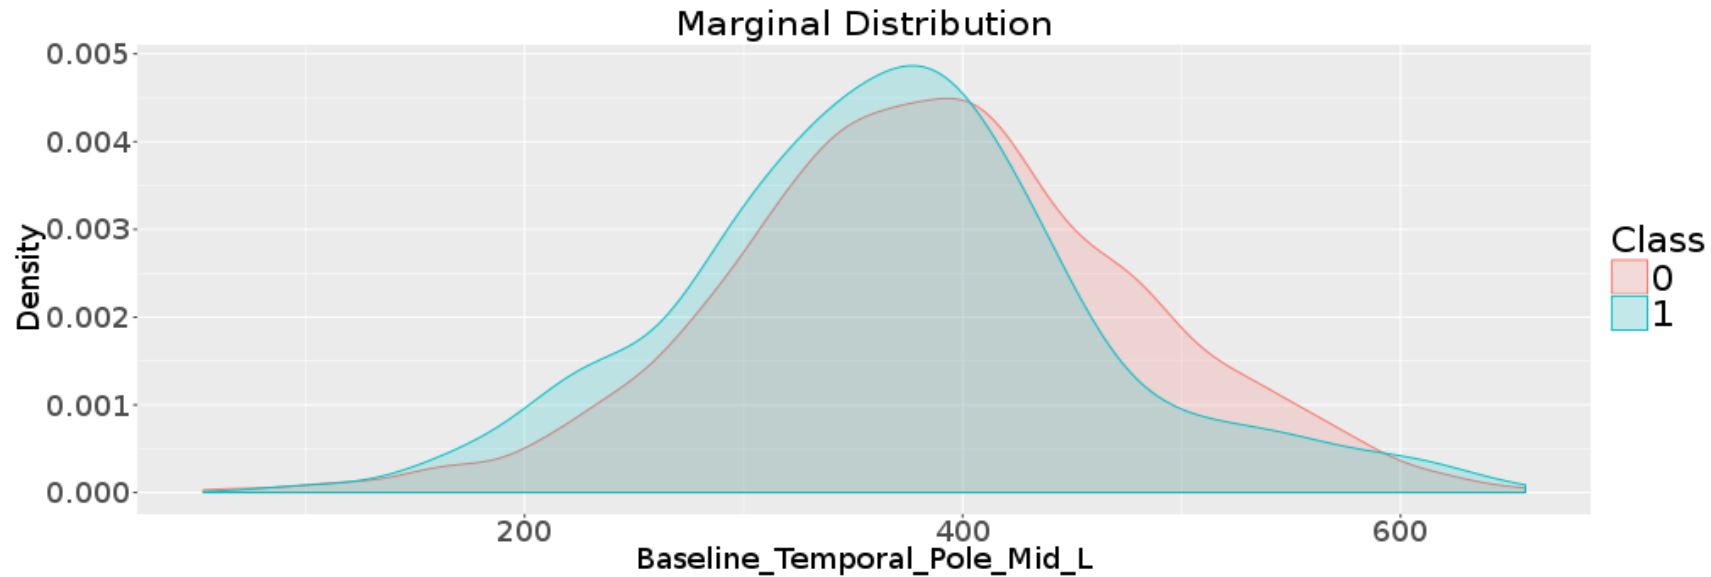

# Marginals do not indicate a clear separation in amygdala

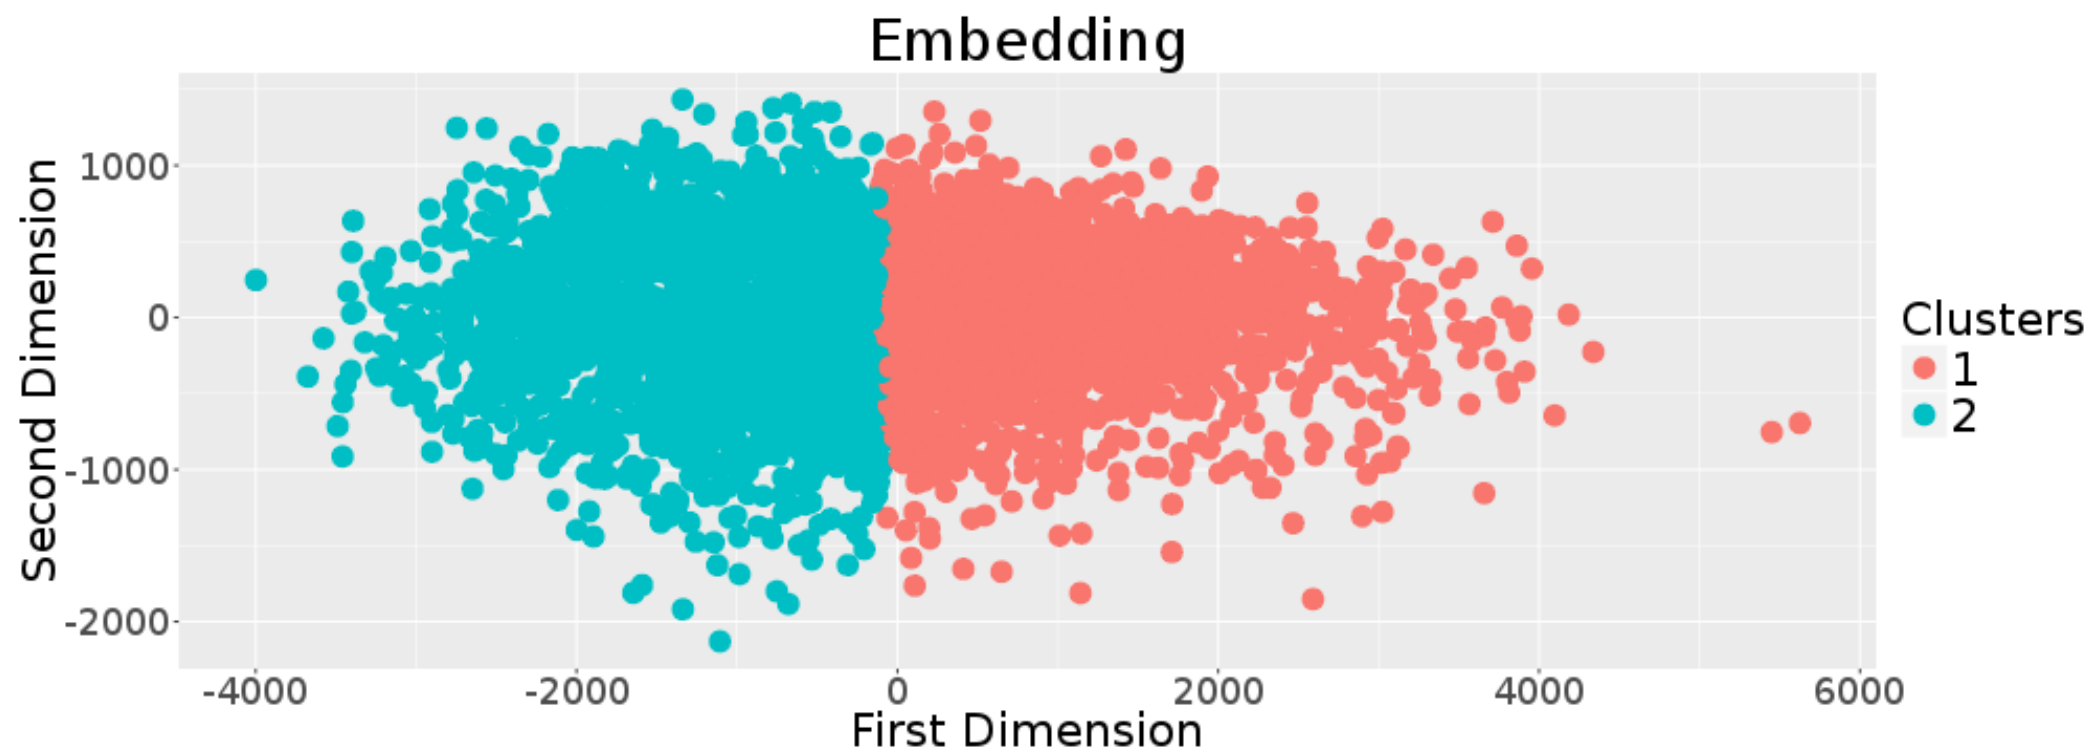

Hippocampus seems to be site of initial loss in AD. Also no obvious difference

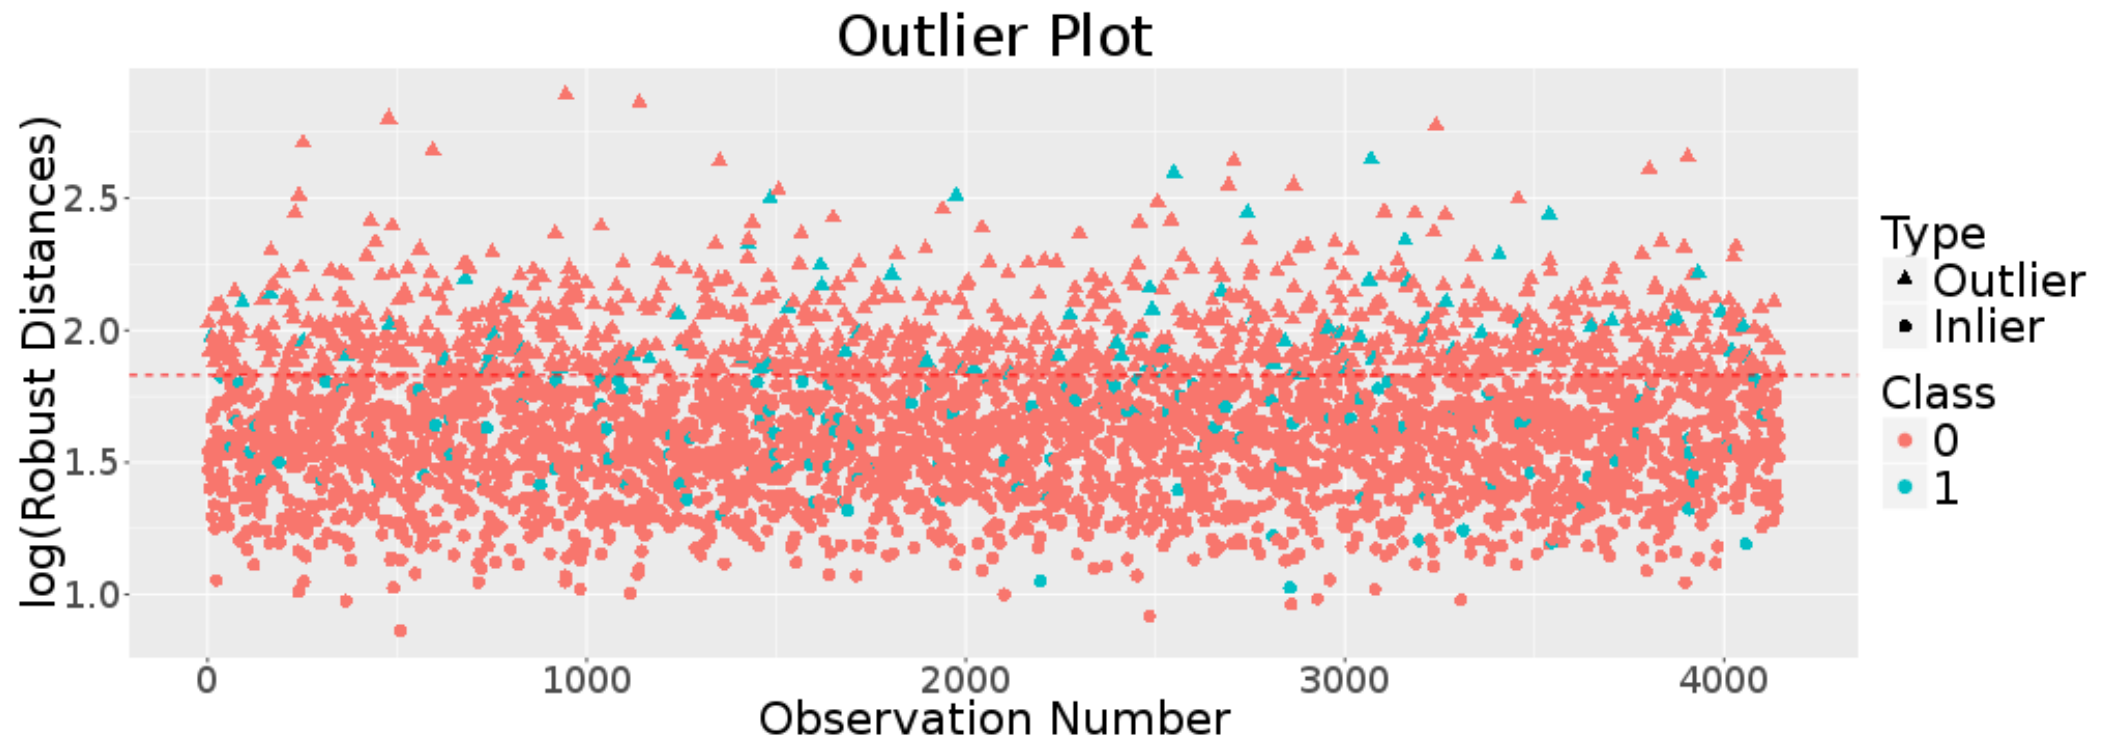

Fronto-temporal dementia is so named because it involved loss of neurons in those regions. Manually parse marginal -> most difference in Temporal\_Pole

Unsurprisingly, naïve PCA onto 2 dimensions does not yield separation

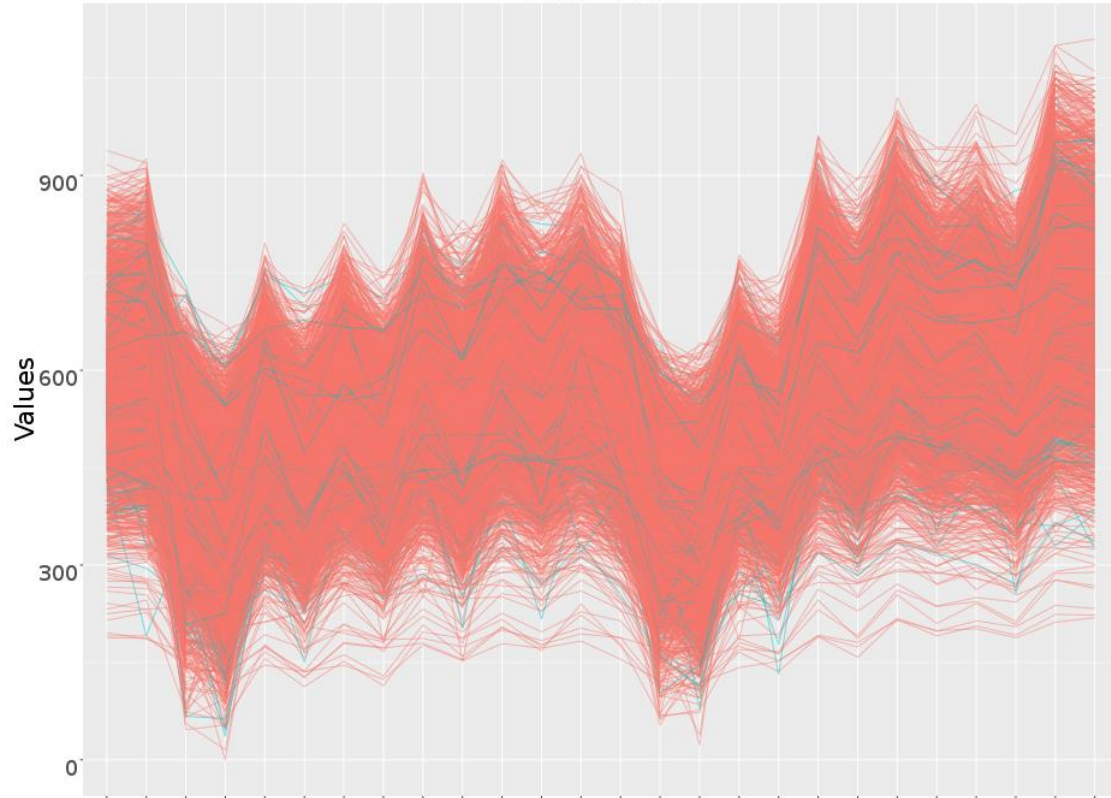

Consider only temporal region and hippocampus -> No obvious difference in robust distances

Consider only temporal region and hippocampus -> line and scatterplots are pretty, but uninformative
